An accessible pedestrian signal and pedestrian push button is an integrated device that communicates information about the WALK and DON’T WALK intervals at signalized intersections in non-visual formats such as audible tones and vibrotactile surfaces to pedestrians who are blind or have low vision. The push button has a locator tone for detecting the device and a tactile arrow to indicate which pedestrian street crossing is served by the device.

ADA guidelines require accessible pedestrian signals and pedestrian push buttons to be provided whenever new pedestrian signals are installed.
